

Routine cine supports bounded regional strain claims; whether a focal deficit is recovered must be tested attribute by attribute

● OBSERVED

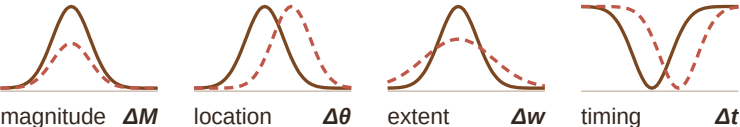

Routine cine CMR

boundaries · weak texture · time
no material label

● INFERRED

Attributes of a focal deficit, each with its own error

— reference - - - estimate (schematic)
tested per attribute, per estimator, per acquisition

● VALIDATED BY

- **Known motion** phantom, simulation
- **Paired DENSE / tagging** same session
- **Tissue & outcome** LGE, events

Reviewed estimator entries (Table S3, n = 48)

14 material-sensitive reference
1 prescribed focal deficit

- ✓ Supported: whole-slice, global and segmental Ecc under matched definitions
- ⊗ Weaker: radial strain; focal boundary, extent and timing, rarely tested
